Assembly program: Phrap; version 0.990399  * NOTE: This record contains 96 individual  * sequencing reads that have not been assembled into  * sequencing reads that have not been assembled into  * contigs. Runs of N are used to separate the reads  * and the order in which they appear is completely  * arbitrary. Low-pass sequence sampling is useful for  * identifying clones that may be gene-rich and allows  * overlap relationships among clones to be deduced.  * However, it should not be assumed that this clone  * will be sequenced to completion. In the event that  * the record is updated, the accession number will  * be preserved.  887: contig of 887 bp in length  agap of unknown length	JOURNAL Unpublished JOURNAL Unpublished REFERENCE 2 (bases 1 to 83775) ROWEN, L., Madan, A., Qin, S., Abbasi, N., Baradarani, L., Birditt, B., Bloom, S., Dors, M., Dickhoff, R., Fleetwood, P., Harrison, G., James, R., Kaur, A., Madan, A., Owen, M.P., Ratcliffe, A., Shaffer, T. and Hodd, L.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to a method for diagnosing a disorder characterised by expression of a human cancer associated antigen precursor coded for by a nucleic acid molecule (NAM). The method comprises: (a) contacting a biological sample isolated from a subject with an agent that specifically binds to the NAM, an expression product or a fragment of an expression product complexed with an HLA molecule; and (b) determining the interaction between the agent and the NAM or the expression product as a determination of the disorder. The products and methods can be used in the diagnosis, monitoring, research, or treatment of conditions characterised by the expression of various cancer associated antigens. The invention provides nucleic acid sequences and encoded polypeptides which are cancer associated antigen precursors expressed in human breast cancer, renal cancer, colon cancer, gastric cancer, prostate cancer and human cancer.

CC full-length cDNAs defined in the specification. Where a primer set comprises: (a) an oligo-dr primer and an oligonucleotide complementary strand of a polynucleotide which complementary controlled complementary strand of a polynucleotide which comprises one of the 5602 nucleotide sequences defined in the specification, where the coligonucleotide comprises at least 15 nucleotides; or (b) a combination of a polynucleotide of a polynucleotide of a polynucleotide which comprises at sequence complementary to the complementary strand of a polynucleotide which comprises a 5'-end complementary to a complementary to the complementary to the complementary to a complementary to the complementary to a complementary to the complementary to a complementary
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           29-JUL-1999;

The present invention describes primer sets for synthesising 5602 cc full-length cDNAs defined in the specification. Where a primer set comprises: (a) an oligo-dT primer and an oligonucleotide complementary to the complementary strand of a polynucleotide which comprises one of cc the 5602 nucleotide sequences defined in the specification, where the cc oligonucleotide comprises at least 15 nucleotides; or (b) a combination cc of an oligonucleotide comprising a sequence complementary to the complementary strand of a polynucleotide which comprises a 5'-end cc complementary to a combination cc oligonucleotide which comprises a 3'-end sequence complementary to a cc oligonucleotide which comprises a 3'-end sequence complementary to a cc oligonucleotide which comprises a 1 last 15 nucleotides and the combination of cc the 5'-end sequence/3'-end sequence; where the combination of cc the 5'-end sequence/3'-end sequence is selected from those defined in cc the specification. The primers are useful for synthesising polynucleotides, and the specification and/or diagnosis of the abnormality of the proteins encoded by the full-length cDNAs. The primers are also useful for the cc challsoff company without any specialised methods. AAH03166 to AAH13628 and cc AAH13633 to AAH13672 represent human amino acid sequences; AAB92446 to AAH13632 cof the present lovention.

                                                                                                                                                                                                                                                                                                                                                                                 CC AAA43426 to AAA45925 represent specifically claimed secreted expressed CC sequence tags (sESTs), isolated from human, mouse, chicken and rat CC tissue sources. The sESTs can have a range of activities depending on CC the tissues they were isolated from. The activities include: CC chemotactic; proliferative; immunomodulatory; haematopoietic; chemotactic; antibacterial; antifungal; antivital; antidiabetic; chemotactic; antiparkinsonian; antiporiatic; cerebopotective; cC cytostatic; antiparkinsonian; antipsoriatic; cereboprotective; cc antionvulsant; and antidepressant. The sESTs can be used for gene CC therapy and in vaccines. The sESTs are useful as probes for the CC dentification and isolation of full-length cDNAs and genomic DNA CC are useful in assays for determining biological activity and raising CC antibodies. They may be useful for treatment of autoimmune disorders (asthma), myeloid or lymphoid cell deficiencies, wounds, burns, ulcers, CC (asthma), myeloid or lymphoid cell deficiencies, wounds, burns, ulcers, CC (Alzheimer's, Parkinson's, Huntington's disease, stroke), coagulation con disorders (haemophilia, thrombosis), inflammatory disorders (CC offices), bacterial, fungal or viral infections, depression and CC psoriasis. AAA45926 to AAA45931 represent linker variants which are given to the exemplification of the present invention.

Colon tumor associated proteins and nucleic acids useful for the prevention, diagnosis and treatment of colonic cancer -

Claim 25;

Page

308; 472pp; English

the

present invention describes colon tumour associated proteins (I) and polynucleotides (II) that encode them. (I) have cytostatic activity.

(1) and (11) may be used in the prevention, disposis and treatment of diseases cossociated with inappropriate colon tumour associated protein (TCAP) CC expression, such as colonic cancer. For example, (1) and (11) may be considered to treat disorders associated with decreased expression by considered to treat disorders associated with decreased expression by considered the treat disorders associated with decreased expression by considered the treat of TCAPs by expressing inactive proteins or to supplement the complement the complement of them. Additionally, (II) may be used to produce the TCAP proteins, by inserting the nucleic acids into a host call culturing the cell to express the protein. (II) and its complementary sequences may also be used as DNA probes in diagnostic complementary sequences may also be used as DNA probes in diagnostic complementary sequences may also be used as DNA probes in diagnostic complementary sequences may also be used as Contilitate the presence of final production of antibodies against TCAPs cand in assays to identify modulators of TCAP expression and activity. The anti-(I) antibodies may also be used to down regulate contility and activity. The anti-(I) antibodies may also be used contility and activity. The anti-(I) antibodies may also be used contility and activity. The anti-(I) antibodies may also be used contility and activity. The anti-(I) antibodies may also be used contility and activity. The anti-(I) antibodies may also be used contility and activity. The anti-(I) antibodies may also be used contility of the anti-(I) antibodies may also be used contility and activity. The anti-(I) antibodies may also be used contility and activity. The anti-(I) antibodies may also be used contility and activity. The anti-(I) antibodies may also be used contility and activity. The present invention describes differentially expressed genes involved CC in angiogenesis (I), and the polypeptides that encode them. (I) have CC cardiovascular activity, and can be used in the modulation of angiogenesis. The nucleic acids and polypeptides may be used in the CC cardiovascular activity, and treatment of diseases associated with CC inappropriate angiogenesis. The polypeptides may also be used as antigens CC in the production of antibodies against them and in assays to identify CC modulators of their expression and activity. The antibodies and activity and activity and modulate angiogenesis. The antibodies may also be used as diagnostic capents for detecting the presence of the polypeptides in samples. CC Disorders that may be prevented, diagnosed and/or treated by the above CC methods include, for example vascular tumours, proliferative tumours, cc atherosclerosis, ovarian hyperstimulation, psoriasis, endometriosis cassociated with neovascularisation, restenosis subsequent to balloon angioplasty, scar tissue over production. peripheral vascular disease, hypertension, inflammatory vasculitides, Reynaud's disease and CC lymphangitis, lymphedema, wound healing and tissue repair, ischaemia CC lymphangitis, lymphedema, wound healing and tissue repair, ischaemia CC conditions, heart failure such as congestive heart failure, age-related conditions, heart failure such as congestive heart failure, age-related conditions and consension of the sevenal in the exemplification of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             seq_name: /SIDS2/gcgdata/geneseq/geneseqn/NA2001.DAT:AAH22255
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Human; differentially expressed gene; anglogenesis; diagnosis; anglogenic disorder; wound healing; cancer; cardiovascular; psoriasis; vascular tumour; proliferative tumour; proliferative vitreoretinopathy; rheumatoid arthritis; Crohn's disease; atherosclerosis; endometriosis; neovascularisation; restenosis; hypertension; aneurysm; angina; myocardial infarction; chronic heart condition; osteoporosis; ds.

The polynucleotides are useful CC in gene therapy. A composition containing a polypeptide or polynucleotide CC of the invention may be used to treat diseases of the peripheral nervous System, such as peripheral nervous injuries, peripheral neuropathy and CC localised neuropathies and central nervous system diseases, such as CC Alzhelmer's, Parkinson's disease, Huntington's diseases, such as CC utilisation of the activities such as: Immune system suppression, CC Activin/inhibin activity, chemotactic/chemokinetic activity, haemostatic CC and thrombolytic activity, cancer diagnosis and therapy, drug screening, CC assays for receptor activity, arthritis and inflammation, leukaemias and CC. Note: The sequence data for this patent did not form part of the printed CC specification.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Align seg 1/1 to: AAI59207

The invention relates to human nucleic acids (AAI57798-AAI61369) and the encoded polypeptides (AAM38642-AAM42213) with nootropic, immunosuppressant and cytostatic activity. The polynucleotides are useful in gene therapy. A composition containing a polypeptide or polynucleotide of the invention may be used to treat diseases of the peripheral nervous system, such as peripheral nervous injuries, peripheral neuropathy and localised neuropathies and central nervous system diseases, such as localised neuropathies and central nervous system diseases, such as Alzheimer's, Parkinson's disease, Huntington's disease, amyotrophic lateral sclerosis, and Shy-Drager Syndrome. Other uses include the utilisation of the activity semostatic asi immune system suppression, activin/inhibin activity, chemotactic/chemokinetic activity, haemostatic and thrombolytic activity, cancer diagnosis and therapy, drug screening, assays for receptor activity, arthritis and inflammation, leukaemias and

                                                                                                                                                                                                                                                                                                              Transformed cells can be cultured to produce the antigen p162, for in exact (differential) diagnosis of rheumatic disease, i.e. they can detect, in immunoassays, western, etc., rheumatism-specific auto-antibodies. The antigen can be used therapeutically, in the removal of auto-antibodies from the circulation, or when coupled to a cytotoxin, the elimination of auto-antibody-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Auto-antibody; p162; rheumatic disease; antigen;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      254
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to human nucleic acids (AAI57798-AAI61369) and the encoded polypeptides (AAM38642-AAM42213) with nootropic, immunosuppressant and cytostatic activity. The polynucleotides are useful in gene therapy. A composition containing a polypeptide or polynucleotide of the invention may be used to treat diseases of the peripheral nervous system, such as peripheral nervous injuries, peripheral neuropathy and localised neuropathies and central nervous system diseases, such as Alzheimer's, Parkinson's disease, Huntington's disease, amyotrophic utilisation of the activities such as: Inmune system suppression, Activin/inhibin activity, chemotactic/chemokinetic activity, hamostatic assays for receptor activity, cancer diagnosis and therapy, drug screening, assays for receptor activity, arthritis and inflammation, leukaemias and inflammation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Tang YT,

alignment\_scores: Quality: Ratio: alignment\_block: Align seg 1/1 to: AAA09326 US-09-750-590-2 x AAA09326 Percent Similarity: 1197 1047 correspond to known genes. The present sequence has identity with the KIAA0336 mRNA tag gene. The genes encode cancer associated antigen diagnosins. These gene products are useful in methods for preventing, ediagnosing and/or treating disorders, especially cancer, associated with abnormal expression of human cancer associated antigens. The method comprises contacting a sample from a subject with an agent that specifically binds to the nucleic acid molecule or expression product (or fragment) complexed with a human leukocyte antigen (HLA) molecule and determining the interaction between the agent and the nucleic acid molecule or the expression product as a determination of the disorder. 1216 1147 1097 1216 1217 361 347 334 319 997 305 glleLeuLeuAspLysVal.......AspGlyLeuGlnLeuGlnLeuA 319 289 GluAsnGluAspLeuLysGluArgLeuArgLysIleGlnGlnGluGlnAr 305 918 272 881 854 TTAAGGAAAGCCACCTCAAATGCAAAC...... 239 LeuLysThrAlaSerGluAsnSerAsnLysGlyArgGluLeuTrpLysLy 255 Sequence 6773 BP; 2566 A; 1092 C; 1363 G; 1752 T; 0 other; 411 255 sGlyProSerLeuGlnGlnArgAsnLeuSerGlnMetLeuAspGluValA 272 TATCTTAAAAGATGAGGTAACTTATATGAATAATCTTAAGTTAAAAACTTG 1046 snThrLysSerAsnGlnArgGluHisGlnAsnIleGlnAspLeuGluIle 288 snGluGluValMet...ValAlaAspAspLeuGluSerGluLysGlu... 333 ATACATTTGTAGAACAAGTAGTAAATGAAAAAGTCAAACACTTAGAA... ysTyrPheGluSerAspHisLeuGlySerGlySerHisPheArgLysGlu 377 AAATGGATGCTCAACATATAAAGGATGAGTTTTTTCATGAACGGGAAGAC 1096 LysLysGluLeu.. .....AACAGAGAAGTACAGAGTCTTAAGGAACAACAT 1249 euGluLeuAlaLeuProAsnGlnAlaSerTyrSerGluAsnGluIleLeu 427 AspMetLeuLeuLysGlnGlyGlnMetTyrMetThrAspSerGlnCysTh 394 GCTATACTGTAGAACAGCAT... .....GATACCTTAAAAGAACTTGAATCTCAACACAG 996 rSerThrGlyMetProValHisMetGlnSerArgSerMetLeuArgProL 411 ......GluGluSerLeuArgThrIleGluAlaLeuLysSerArgPheL 361 619.00 0.934 53.815 .GluAlaMetArgThrPheCysAspSerAlaLysGl 443 from: 1 Length: 1232

Claim 39; Pages 43-53; 75pp; English

The sequence is that of a mutant rat alpha-myosin heavy chain gene which was used in the development of transgenic mammals, specifically mice. They can be used as a model for studying congestive heart failure (CHF) or hypertrophic cardiomyopathy. Such animals are used to study molecular and cellular events associated with CHF; to identify compounds for treating CHF, and in evaluating effects of diet and exercise on CHF. Conditions associated with that can be evaluated this way are dilated or hypertrophic cardiomyopathy; acute aortic regurgitation; tricuspid stenosis; constrictive pericarditis; acute infective endocarditis; ischaemic heart disease; hypertension; primary myocardial disease; valvular or pericardal disease; hyperthyroidism; anaemia; arteriovenous fistula; beri-beri and Paget's disease.

Sequence 5661 BP; 1572 A; 1446 C; 1797 G; 846 T; 0 other;

The vector can be used in the gene therapy treatment of arteriosclerosis, particularly for the reduction of restenosis occurring
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        This sequence represents the coding sequence for the smooth muscle myosin heavy chain SM1 isoform protein. This SM1 coding sequence was isolated from a mouse embryo cDNA library using probes based on the rabbit smooth muscle myosin heavy chain SM2 isoform. This sequence is included in the gene therapy vector of the invention. The vector of the invention consists of this sequence inserted into a retrovirus, adenovirus,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   DNA encoding smooth muscle myosin heavy chain SM1 isoform - used a vector for gene therapy for reduction of re-stenosis following coronary artery catheterisation
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Smooth muscle; myosin heavy chain; SM1 isoform; rabbit; arteriosclerosis; gene therapy; mouse; SM2 isoform; retrovirus; adenovirus; restenosis; associated adenovirus; coronary artery catheterisation; sclerotic artery;
